Removal of tin from tungsten concentrates. B. Seweryśki, T. Wlazłńska, J. Wojtas, and H. Wójskiewicz. *Rudy i Metale Nieżelazne* 3, 57-60 (1958).—A concentrate averaging WO, 68.24, FeO 17.47, MnO 8.04, SiO₂ 2.47, Sn 1.12, S 0.052, and As 0.15% was defluned in a lab. semirotatory pipe kiln. Internal diam. of pipe and length of the heated part of the kiln, which was inclined at an angle of 10°, were 45 and 300 mm. W concentrates were roasted at 1000 and at 900° for 30-60 min. without reductant or with 5 or 10% addn. of powdered coke (1-5 mm.). Satisfactory results were obtained with 10% coke at 900° for 1 hr.; about 85% of the Sn was removed. Tests were made on a rotatory kiln 4000 mm. long and 350 mm. in diam., rotating at 1 r.p.m. and inclined at an angle of 2°. The kiln was heated with gas. The concentrate without pretreatment was supplied at rates of 16, 40, and 60 kg./hr. Temp. and amts. of coke added were, resp., 900° and 5 and 10%. For 5% of coke added were, resp., 900° and 5 and 10%. For 10% of coke, added at a rate of 16 and 40 kg./hr., max. removal of tin was up to 57 and 26%. For 10%

"O nowej oksydymetrycznej metodzie oznaczenia drobnych ilości magnezu za pomocą oksychinoliny". Przemysł Chemiczny. No. 10, 1954, pp. 540-542, 4 tabs.

A new method of determining small amounts of magnesium, consisting in: precipitating magnesium in appropriate conditions (using hydroxyquinoline), dissolving the precipitate in sulphuric acid and determining the quantity of hydroxyquinoline oxydimetrically (by titration with potassium permanganate). The range of determination using the oxydimetric method is 0.02-5 mg Mg. The results obtained are in accordance with those obtained by the colorimetric hydroxyquinoline method. The method has many advantages and can be applied in serial determination of magnesium analysis. Adaptation of the method remains to be done.

Title : Investigation of the Intermediate Phase in the Bi-Pb System

Orig Pub : Zesz. nauk. Uniw. Jagiell., 1956, No 6, 151-161

Abstract : For the purpose of establishing the boundaries of the region of homogeneity of the intermediate β phase in the system Bi-Pb, use was made of the method whereby the quantity $r = R_N/R_0$ is determined (R_N is the electric resistivity at the boiling temperature N_2 , and R_0 is the same for the temperature of 0°C). This quantity was determined for alloys with 30 to 100 atomic percent lead, soaked for 1500 hours at temperatures of 110, 80 and 50°C and also for alloys soaked for 80 hours at a temperature of 110°C and 1100 hours at 80°C .

POLAND/Solid State Physics - Structure of Alloys and Other Systems E-5

Abs Jour : Ref Zhur = Fizika, No 8, 1958, No 17944

1. In addition, the curve shows two kinks, corresponding to the boundary of the β phase on the side Pb ($\beta/\beta+\delta$) and the boundary of the solid solution on the base of Pb ($\beta+\delta/\delta$). When the temperature increases, the boundary $\alpha+\beta/\beta$ shifts towards the bismuth side (at room temperature approximately 67 atomic percent lead, at 110°C, 58 atomic percent lead), which is in agreement with the literature data. The boundaries $\beta/\beta+\delta$ and $\beta+\delta/\delta$ hardly change with temperature and correspond to a lead content of approximately 71.0 to 71.5 and 83.0 to 83.5 atomic percent respectively.

Abs Jour: Ref Zhur-Khimiya, No 11, 1958, 35392

Abstract: The solubility of Cd in Tl, at a eutectic temperature, equal to 4.5 atom percent, Tl cannot be dissolved in Cd. A temperature hysteresis has been observed in the polymorphous conversion. The transformation temperature of 165°C has been determined from the heating curves (152.5°C from the cooling curves) at room temperature, only an α -modification of Tl has been discovered for Cd-Tl alloys. The results of the Thermal analysis are confirmed by X-ray diffraction studies.

Warsaw, Roczniki Chemii, Vol 37, No 9, 1963, pp 1013-1018.

Abstract: /English article, author's summary modified/ The ratio r_H of the resistance at temperature of boiling nitrogen to the resistance at temperature 0°C for 51 samples of Bi-Tl alloys properly annealed at 50, 100 or 150°C was measured. On the basis of the course of the curves r_H -composition of alloys, conclusions on the regions of existence of separate solid phases were drawn. The results of experiments are given in a table and on a graph. Nineteen

Title : A New Method for Measuring the Viscosity of Liquids.

Orig Pub : Bull Soc Amis Sci et Lettres Poznan, B-14, 283-293, 1956-1957

Abstract : A microviscometer for the determination of the viscosity of small liquid samples (~ 0.5 ml) is described. The liquid is placed in the narrow (~ 1 mm) space between the fixed
